1. Why do we use Code First instead of Database First?

- Code First allows us to create the database from C# classes.
- It makes database changes easier to manage using migrations.
- It keeps database schema changes in source control.

2. Why do we use Fluent API instead of Data Annotations?

- Fluent API supports more complex database configurations.
- It keeps database configuration separate from entity classes.
- It provides more flexibility and control over relationships and mappings.
